Keywords: Direct product of subsets, factoring abelian groups into subsets, normalized, periodic, cyclic, simulated subsets, normalized, periodic factorizations, Hajós's, Rédei's, Sands's theorems.

#### Abstract

The paper answers a particular case of an open problem which attempts to extend Rédei's theorem on decomposing a finite abelian group into a direct product of its subsets.

## 1. Introduction

Let $G$ be a finite abelian group written multiplicatively. Let $A_{1}, \ldots, A_{n}$ be subsets of $G$. The product $A_{1} \cdots A_{n}$ is defined to be the set

$$
\left\{a_{1} \cdots a_{n}: a_{1} \in A_{1}, \ldots, a_{n} \in A_{n}\right\} .
$$

The product $A_{1} \cdots A_{n}$ is called direct if

$$
a_{1} \cdots a_{n}=a_{1}^{\prime} \cdots a_{n}^{\prime}, \quad a_{1}, a_{1}^{\prime} \in A_{1}, \ldots, a_{n}, a_{n}^{\prime} \in A_{n}
$$

imply that $a_{1}=a_{1}^{\prime}, \ldots, a_{n}=a_{n}^{\prime}$. If the product $A_{1} \cdots A_{n}$ is direct and is equal to $G$, then we say that the equation $G=A_{1} \cdots A_{n}$ is a factorization of $G$ into the subsets $A_{1}, \ldots, A_{n}$. A subset $A$ of $G$ is called normalized if $e \in A$, where $e$ is the identity element of $G$. The factorization

[^0]$G=A_{1} \cdots A_{n}$ is termed normalized if each of its factors is a normalized subset of $G$.

A subset $A$ of $G$ is defined to be periodic if there is an element $g \in G \backslash\{e\}$ such that $g A=A$. We call the element $g$ a period of $A$. A factorization $G=A_{1} \cdots A_{n}$ is called periodic if at least one of its factors is a periodic subset of $G$.

Let $a$ be an element of $G$ and let $r$ be an integer such that $2 \leq$ $\leq|a| \leq r$. Here $|a|$ stands for the order of the element $a$. We will call the set of elements $C$ in the form

$$
e, a, a^{2}, \ldots, a^{r-1}
$$

a cyclic subset of $G$. Clearly, $C$ is a subgroup of $G$ if and only if $a^{r}=e$. The element $a^{r}$ is called the terminating element of the cyclic subset $C$. In order to solve a long standing open geometry problem, G. Hajós [4] proved the following theorem in 1941.
Theorem 1. If $G=A_{1} \cdots A_{n}$ is a factorization of the finite abelian group $G$, where each $A_{i}$ is a cyclic subset, then the factorization is periodic.

Further investigations reveal that Hajós's theorem is equivalent to its special case when each cyclic factor has a prime cardinality. This is why the next result of L. Rédei [5] can be considered as a generalization of Hajós's theorem.
Theorem 2. Let $G=A_{1} \cdots A_{n}$ be a normalized factorization of the finite abelian group $G$ such that each $\left|A_{i}\right|$ is a prime, then the factorization is periodic.

Let $H=\left\{h_{1}, h_{2}, \ldots, h_{s}\right\}$ be a subgroup of $G$ with $h_{1}=e, s \geq 3$. A subset $A$ of $G$ in form

$$
A=\left\{h_{1}, h_{2}, \ldots, h_{s-1}, h_{s} d\right\}
$$

is called a simulated subset, where $d$ is an element of $G$ such that $h_{s} d \notin$ $\notin\left\{h_{1}, h_{2}, \ldots, h_{s-1}\right\}$. In Hajós's theorem simulated subsets may appear beside the cyclic subsets. The following theorem was proved in [11].
Theorem 3. If $G=A_{1} \cdots A_{n}$ is a factorization of the finite abelian group $G$, where each $A_{i}$ is a cyclic subset or a simulated subset, then the factorization is periodic.

For cyclic groups a more general result than Rédei's theorem holds as it was shown by A. D. Sands [8] in 2004.
Theorem 4. If $G=A_{1} \cdots A_{n}$ is a factorization of the finite cyclic group $G$ such that each $\left|A_{i}\right|$ is a prime power or a product of two primes, then the factorization is periodic.

Hajós's theorem admits a similar generalization. Namely, in 2008 A. D. Sands [9] proved the following theorem.

Theorem 5. Let $G=B A_{1} \cdots A_{n}$ be a normalized factorization of the finite abelian group $G$ such that each $A_{i}$ is a cyclic subset or a simulated subset of $G$ and $|B|=p q$, where $p, q$ are distinct primes. Then the factorization is periodic.

An example of [1] shows that the conditions that the $A_{i}$ factors are all cyclic or simulated cannot be dropped from Th. 5. Motivated by the above results [13] advanced the next problem.
Problem 1. Let $p, q$ be not necessarily distinct primes and let $G$ be a finite abelian group whose $p$-component and $q$-component are cyclic. Suppose that $G=B A_{1} \cdots A_{n}$ is a normalized factorization of $G$ such that $|B|=p q$ and each $\left|A_{i}\right|$ is a prime. Does it imply that the factorization is periodic?

In [13] it was proved that if the primes $p$ and $q$ are equal, then the answer for Problem 1 is "yes". When the primes $p$ and $q$ are distinct then the answer for Problem 1 is "yes" for $n \leq 3$. This paper will extend the above result for $n=4$. We spell out this assertion formally as a theorem.
Theorem 6. Let $p, q$ primes and let $G$ be a finite abelian group with cyclic $p$-component and with cyclic $q$-component. Let $G=B A_{1} \cdots A_{n}$ be a normalized factorization of $G$ such that $|B|=p q$ and each $\left|A_{i}\right|$ is a prime. If $n \leq 4$, then the factorization is periodic.

## 2. Preliminaries

In this section we present some preliminary results. For easier reference we cite a result of [13].
Theorem 7. Let $p$ be a prime and let $G$ be a finite abelian group whose p-component is cyclic. Let $G=B A_{1} \cdots A_{n}$ be a normalized factorization of $G$ such that $|B|=p^{\alpha}$ and each $\left|A_{i}\right|$ is a prime. Then the factorization is periodic.

Let $G=A B$ be a normalized factorization of $G$, where $|A|=p$ is a prime. Choose an element $a \in A \backslash\{e\}$ and set

$$
\begin{equation*}
C=\left\{e, a, a^{2}, \ldots, a^{p-1}\right\} \tag{1}
\end{equation*}
$$

By Lemma 3 of [12] in the factorization $G=A B$ the factor $A$ can be replaced by $C$ to get the factorization $G=C B$. Since $|C|=p$ is a prime
and since $C$ is normalized, it follows that if $C$ is periodic then it is a subgroup of $G$ and so $a^{p}=e$. Conversely if $a^{p}=e$, then $C$ is a subgroup of $G$ and so it is a periodic subset of $G$. In other words $C$ is periodic if and only if $|a|=p$.

If $|a|=p$ for each $a \in A \backslash\{e\}$, then we say that $A$ is a type 1 subset of $G$. A type 1 subset $A$ of $G$ can be represented in the form

$$
A=\left\{e, a, a^{2} \rho_{2}, \ldots, a^{p-1} \rho_{p-1}\right\}, \quad\left|\rho_{i}\right|=p
$$

If $|a| \neq p$ for some $a \in A \backslash\{e\}$, then we say that $A$ is a type 2 subset of $G$. In this case the cyclic subset (1) is not periodic. For a type 2 subset $A$ we distinguish two subtypes.

In a typical situation $|a|$ can be written in the form $|a|=p^{\alpha} m$, where $p$ does not divide $m$. Choose an integer $t$ which is not divisible by $p$ and set

$$
C^{\prime}=\left\{e, a^{t},\left(a^{t}\right)^{2}, \ldots,\left(a^{t}\right)^{p-1}\right\} .
$$

By Prop. 3 of [7] in the factorization $G=C B$ the factor $C$ can be replaced $C^{\prime}$ to get the factorization $G=C^{\prime} B$.

If $\alpha \geq 2$, then we can choose $t$ such that $\left|a^{t}\right|=p^{\alpha}$ and so $C^{\prime}$ is not a periodic subset of $G$. In this case we call $A$ a type 2a subset of $G$.

If $\alpha=1$, then we can choose $t$ such that $\left|a^{t}\right|=p q$, where $q$ is a prime distinct from $p$. Now $C^{\prime}$ is not a periodic subsets of $G$. In this case we call $A$ a type 2b subset of $G$.

If $\alpha=0$, then we can choose $t$ such that $a^{t}=e$. Now $C^{\prime}$ is a multiset that contains the identity element $e$ with multiplicity $p$ and so the product $C^{\prime} B$ cannot form a factorization of $G$. Therefore the $\alpha=0$ case cannot arise in connection with factorizations.

We may sum up our considerations in the following way. Suppose that $G=A B$ is a normalized factorization, where $|A|=p$ is a prime. If $A$ is a type 1 subset of $G$, then in the factorization $G=A B$ we do not replace $A$. If $A$ is a type 2 subset of $G$, then in the factorization $G=A B$ we replace $A$ by the non-periodic cyclic subset (1) to get the factorization $G=C B$. If $A$ is a type 2 a subset of $G$, then we may assume that $|a|=p^{\alpha}$, where $\alpha \geq 2$ holds in (1). If $A$ is a type 2 b subset of $G$, then we may assume that $|a|=p q$ holds in (1), where $q$ is a prime distinct from $p$.

Assume that $G=B A_{1} \cdots A_{n}$ is a normalized factorization such that each $\left|A_{i}\right|=p_{i}$ is a prime and each $A_{i}$ is a non-periodic subset. Set

$$
D_{i}=\left\{\begin{array}{lll}
A_{i}, & \text { if } & A_{i}
\end{array} \text { is a type } 1 \text { subset }, ~ \begin{array}{ll}
C_{i}, & \text { if } \\
A_{i} & \text { is a type } 2 \text { subset }
\end{array}\right.
$$

where $a_{i} \in A_{i} \backslash\{e\}$

$$
\begin{aligned}
A_{i} & =\left\{e, a_{i}, a_{i}^{2} \rho_{i, 2}, \ldots, a_{i}^{p_{i}-1} \rho_{i, p_{i}-1}\right\}, \quad\left|\rho_{i, j}\right|=p_{i} \\
C_{i} & =\left\{e, a_{i}, a_{i}^{2}, \ldots, a_{i}^{p_{i}-1}\right\} .
\end{aligned}
$$

In the factorization $G=B A_{1} \cdots A_{n}$ we replace each $A_{i}$ by $D_{i}$ to get the factorization $G=B D_{1} \cdots D_{n}$. Since $A_{i}$ is not periodic we know that $D_{i}$ is not periodic either. We call the subset $D_{i}$ the standardized version of $A_{i}$.

For a subset $A$ of $G$ the notation $\langle A\rangle$ stands for the smallest subgroup of $G$ that contains $A$. The subgroup $\langle A\rangle$ is referred to as the span of $A$ in $G$ or as the generatum of $A$ in $G$. One also may say that $A$ spans or generates the subgroup $\langle A\rangle$ in $G$. For a subset $A$ and for a character $\chi$ of $G$ the notation $\chi(A)$ stands for the sum

$$
\sum_{a \in A} \chi(a) .
$$

Let $p, q$ be distinct primes and let $G$ be a finite abelian group whose $p$-component and $q$-component are cyclic. Let $G=B A_{1} \cdots A_{n}$ be a normalized factorization of $G$, where $|B|=p q$ and each $\left|A_{i}\right|$ is a prime. Suppose that the factors $A_{1}, \ldots, A_{s}$ are cyclic and the terminating element of $A_{i}$ has order $p^{\alpha}, \alpha \geq 1$ or $q^{\beta}, \beta \geq 1$ for each $i, 1 \leq i \leq s$. Consider the subgroup $H=\left\langle A_{s+1} \cup \cdots \cup A_{n}\right\rangle$ of $G$. We will use the next lemma later several times.
Lemma 1. If $|H|=\left|A_{s+1}\right| \cdots\left|A_{n}\right|$, then one of the factors $A_{s+1}, \ldots, A_{n}$ is periodic. If $|H|=p^{\gamma}\left|A_{s+1}\right| \cdots\left|A_{n}\right|, \gamma \geq 1$ or $|H|=q^{\delta}\left|A_{s+1}\right| \cdots\left|A_{n}\right|$, $\delta \geq 1$, then $B$ is periodic.
Proof. From $|H|=\left|A_{s+1}\right| \cdots\left|A_{n}\right|$ it follows that the product $A_{s+1} \cdots A_{n}$ forms a factorization of $H$. By Th. 2 at least one of the factors $A_{s+1}, \ldots, A_{n}$ is periodic. This completes the proof of the first statement of the lemma.

Next assume that $|H|=p^{\gamma}\left|A_{s+1}\right| \cdots\left|A_{n}\right|, \gamma \geq 1$ and try to show that $B$ is periodic. Setting $C=B A_{1} \cdots A_{s}$ and $D=A_{s+1} \cdots A_{n}$ from the factorization $G=B A_{1} \cdots A_{s} A_{s+1} \cdots A_{n}$ we get the normalized factorization $G=C D$ of $G$. Choose an element $c \in C$. Multiplying both sides of the factorization $G=C D$ by $c^{-1}$ we get the normalized factorization $G=G c^{-1}=\left(C c^{-1}\right) D$ of $G$. Restricting the factorization $G=\left(C c^{-1}\right) D$ to $H$ we end up with the normalized factorization $H=G \cap H=\left[\left(C c^{-1}\right) \cap H\right] D$. It follows that $|H|=\left|\left(C c^{-1}\right) \cap H\right||D|$.

Using $|H|=p^{\gamma}\left|A_{s+1}\right| \cdots\left|A_{n}\right|=p^{\gamma}|D|$ we get that $\left|\left(C c^{-1}\right) \cap H\right|=p^{\gamma}$. From the factorization

$$
H=\left[\left(C c^{-1}\right) \cap H\right] A_{s+1} \cdots A_{n}
$$

by Th. 7, we get that at least one of the factors $\left(C c^{-1}\right) \cap H, A_{s+1}, \ldots, A_{n}$ is periodic. Only $\left(C c^{-1}\right) \cap H$ can be periodic.

The $p$-component of $G$ is cyclic and so it has a unique subgroup $K$ of order $p$. The elements of $K \backslash\{e\}$ are periods of $\left(C c^{-1}\right) \cap H$. As $\left(C c^{-1}\right) \cap H$ is a normalized subset, $K \subseteq\left[\left(C c^{-1}\right) \cap H\right]$ must hold. In particular

$$
\bigcap_{c \in C} C c^{-1} \neq\{e\}
$$

From this, by Lemma 3 of [2], $C$ is periodic.
By Th. 1 of [10], the fact that the elements of $K \backslash\{e\}$ are periods of $C$ can be expressed equivalently using characters of $G$. Namely, $\chi(K)=0$ implies $\chi(C)=0$ for each character $\chi$ of $G$.

Since the $q$-component of $G$ is cyclic, there is a unique subgroup $L$ of $G$ of order $q$. We claim that $\chi(K)=0, \chi(L)=0$ implies $\chi(B)=0$ for each character $\chi$ of $G$.

In order to prove the claim choose a character $\chi$ of $G$ for which $\chi(K)=0$ and $\chi(L)=0$. Using $\chi(K)=0$ we get

$$
0=\chi(C)=\chi\left(B A_{1} \cdots A_{s}\right)=\chi(B) \chi\left(A_{1}\right) \cdots \chi\left(A_{s}\right)
$$

Thus $\chi(B)=0$ or $\chi\left(A_{i}\right)=0$ for some $i, 1 \leq i \leq s$. If $\chi(B)=0$, then there is nothing left to prove. Therefore we may assume that $\chi\left(A_{i}\right)=0$ for some $i, 1 \leq i \leq s$. Set $A_{i}=\left\{e, a, a^{2}, \ldots, a^{r-1}\right\}$. The terminating element of $A_{i}$ is $a^{r}$ and we have assumed that the order of $a^{r}$ is either $p^{\alpha}, \alpha \geq 1$ or $q^{\beta}, \beta \geq 1$. If $\left|a^{r}\right|=p^{\alpha}$, then set $b=a^{r p^{\alpha-1}}$ and if $\left|a^{r}\right|=q^{\beta}$, then set $b=a^{r q^{\beta-1}}$.

This means that $b \in K$ or $b \in L$. Note that $\chi\left(A_{i}\right)=0$ is equivalent to that $\chi(a) \neq 1$ and $\chi\left(a^{r}\right)=1$. But $\chi\left(a^{r}\right)=1$ cannot hold as $\chi(K)=0$ and $\chi(L)=0$ imply $\chi(b) \neq 1$. This contradiction proves the claim.

By Th. 2 of [10], there are subsets $S, T$ of $G$ such that $B$ can be represented in the form

$$
\begin{equation*}
B=S K \cup T L \tag{2}
\end{equation*}
$$

where the products are direct and the union is disjoint. Considering the cardinalities in (2) we get

$$
p q=|B|=|S| p+|T| q
$$

It follows that $q$ divides $|S|$ and $p$ divides $|T|$. Using $|S| \geq 0,|T| \geq 0$ we can draw the conclusion that either $S=\emptyset$ and so the elements of $L \backslash\{e\}$ are periods of $B$ or $T=\emptyset$ and so the elements of $K \backslash\{e\}$ are periods of $B$. $\diamond$

Let $q_{1}, \ldots, q_{n}$ be (not necessarily distinct) prime powers. The direct product of cyclic subgroups of orders $q_{1}, \ldots, q_{n}$ respectively must be a commutative group $G$. We refer to $G$ as a group of type $\left(q_{1}, \ldots, q_{n}\right)$.

Suppose that the answer for Problem 1 is "no". This means that there is a finite abelian group $G$ whose $p$-component and $q$-component are cyclic, where $p, q$ are primes. Further there is a normalized factorization $G=B A_{1} \cdots A_{n}$ such that $|B|=p q$, each $\left|A_{i}\right|$ is a prime and none of the factors $B, A_{1} \ldots, A_{n}$ is periodic. Let us call such a factorization simply a counter-example.

From Th. 7 we know that in a counter-example $p$ and $q$ must be distinct primes. From Th. 4 we know that in a counter-example $G$ cannot be a cyclic group.
Lemma 2. In a counter-example the p-component of $G$ is of order $p$ and the $q$-component of $G$ is of order $q$.
Proof. Let $G=B A_{1} \cdots A_{n}$ be a counter-example. Suppose that the $p$-component of $G$ is of order $p^{\lambda}$ and the $q$-component of $G$ is of order $q^{\mu}$. We know that $\lambda \geq 1, \mu \geq 1$. By symmetry we may assume that $\lambda \geq \mu$. If $\lambda=\mu=1$, then there is nothing to prove. Thus we may assume that $\lambda \geq 2$.

Let $A_{1}, \ldots, A_{s}$ be all the factors among $A_{1}, \ldots, A_{n}$ whose cardinality is equal to $p$. Clearly, $s=\lambda-1$.

Note that $A_{i}$ cannot be a type 1 subset of for each $i, 1 \leq i \leq s$. Indeed, if $A_{i}$ is a type 1 subset of $G$ for some $i, 1 \leq i \leq s$, then each element of $A_{i} \backslash\{e\}$ has order $p$ and consequently $A_{i}$ is equal to the unique subgroup of $G$ of order $p$. This is an outright contradiction.

Therefore $A_{i}$ is a type 2 a or type 2 b subset of $G$ for each $i, 1 \leq i \leq s$. If $A_{i}$ is a type 2 a subset of $G$, then $A_{i}$ is a cyclic subset of $G$ in the form

$$
A_{i}=\left\{e, a_{i}, a_{i}^{2}, \ldots, a_{i}^{p-1}\right\}, \quad\left|a_{i}\right|=p^{\alpha_{i}}, \quad \alpha_{i} \geq 2
$$

We set

$$
C_{i}=\left\{e, c_{i}, c_{i}^{2}, \ldots, c_{i}^{p-1}\right\}, \quad a_{i}=c_{i}
$$

Plainly, $A_{i}$ can be replaced by $C_{i}$ in the factorization $G=B A_{1} \cdots A_{n}$ as $A_{i}=C_{i}$. If $A_{i}$ is a type 2 b subset of $G$, then $A_{i}$ is a cyclic subset of $G$ in the form

$$
A_{i}=\left\{e, a_{i} b_{i},\left(a_{i} b_{i}\right)^{2}, \ldots,\left(a_{i} b_{i}\right)^{p-1}\right\}, \quad\left|a_{i}\right|=p
$$

and $\left|b_{i}\right|$ is a prime. In this case we can write $\left|a_{i}\right|$ in the form $p^{\alpha_{i}}$ with $\alpha_{i}=1$. We set

$$
C_{i}=\left\{e, c_{i}, c_{i}^{2}, \ldots, c_{i}^{p-1}\right\}, \quad a_{i}=c_{i} .
$$

In the factorization $G=B A_{1} \cdots A_{n}$ the factor $A_{i}$ can be replaced by $C_{i}$ as there is an integer $t$ relatively prime to $p$ such that $A_{i}^{t}=C_{i}$. Namely, the choice $t=\left|b_{i}\right|$ is suitable.

We claim that the numbers $\alpha_{1}, \ldots, \alpha_{s}$ are distinct. In order to prove the claim assume on the contrary that there are $i, j, 1 \leq i<j \leq s$ such that $\alpha_{i}=\alpha_{j}$. For the sake of definiteness we assume that $i=1$, $j=2$.

In the factorization $G=B A_{1} A_{2} A_{3} \cdots A_{n}$ we replace the factors $A_{1}, A_{2}$ by $C_{1}, C_{2}$ to get the factorization $G=B C_{1} C_{2} A_{3} \cdots A_{n}$. As $\left|c_{1}\right|=\left|C_{2}\right|$, there is an integer $t$ relatively prime to $p$ such that $c_{i}^{t}=c_{2}$. In the factorization $G=B C_{1} C_{2} A_{3} \cdots A_{n}$ we replace the factor $C_{1}$ by $C_{1}^{t}$ to get the factorization $G=B C_{1}^{t} C_{2} A_{3} \cdots A_{n}$. Now $C_{1}^{t}=C_{2}$ and so the product $C_{1}^{t} C_{2}$ cannot be direct. This contradiction proves the claim.

We may assume that $\lambda \geq \alpha_{1}>\cdots>\alpha_{s} \geq 1$. Set $H=\left\langle A_{1} \cup\right.$ $\left.\cup \cdots \cup A_{n}\right\rangle$. If $\alpha_{1}<\lambda$, then $|G: H|=p^{\alpha}, \alpha \geq 1$. So Lemma 1 is applicable and it gives that the factorization $G=B A_{1} \cdots A_{n}$ is periodic. Thus we may assume that $\alpha_{1}=\lambda$. Set $H=\left\langle A_{2} \cup \cdots \cup A_{n}\right\rangle$. From the factorization $G=\left(B A_{1}\right) A_{2} \cdots A_{n}$, by Lemma 1, we get that the factorization $G=B A_{1} \cdots A_{n}$ is periodic. (If $|H|=\left|A_{2}\right| \cdots\left|A_{n}\right|$, then one of the factors $A_{2}, \ldots, A_{n}$ is periodic. If $|H| \neq\left|A_{2}\right| \cdots\left|A_{n}\right|$, then $B$ is periodic.) $\diamond$

Let $m$ be an integer such that the answer for Problem 1 is "yes" for each $n, n \leq m-1$. Let $G=B A_{1} \cdots A_{m}$ be a normalized factorization such that the $p$-component of $G$ is of order $p$ and the $q$-component of $G$ of is of order $q$. Further $|B|=p q$ and each $A_{i}$ is a non-periodic standardized subset of $G$ of prime cardinality. We assume that $A_{m}$ is a type 1 subset of $G$ in the form

$$
A_{m}=\left\{e, a, a^{2} \rho_{2}, \ldots, a^{r-1} \rho_{r-1}\right\}
$$

$\left|\rho_{i}\right|=r$ is a prime $r \geq 3$. We may assume that at least one of $\rho_{2}, \ldots, \rho_{r-1}$ is distinct from $e$. For the sake of simplicity we assume that $\rho_{2} \neq e$. In addition we assume that the $r$-component of $G$ is an elementary $r$-group, that is, the $r$-component of $G$ is of type $(r, \ldots, r)$.

In the factorization $G=B A_{1} \cdots A_{m}$ the factor $A_{m}$ can be replaced by the subgroup $H=\langle a\rangle$ to get the factorization $G=B A_{1} \cdots A_{m-1} H$.

By considering the factor group $G / H$ we get the factorization

$$
\begin{equation*}
G / H=[(B H) / H]\left[\left(A_{1} H\right) / H\right] \cdots\left[\left(A_{m-1} H\right) / H\right] \tag{3}
\end{equation*}
$$

of the factor group $G / H$.
Multiplying the factorization $G=B A_{1} \cdots A_{m}$ by $a^{-1}$ we get the factorization $G=g a^{-1}=B A_{1} \cdots A_{m-1}\left(A_{m} a^{-1}\right)$. In this factorization the factor $\left(A_{m} a^{-1}\right)$ can be replaced by the subgroup $K=\left\langle a \rho_{2}\right\rangle$ to get the factorization $G=B A_{1} \cdots A_{m-1} K$. Passing to the factor group $G / K$ gives the factorization

$$
\begin{equation*}
G / K=[(B K) / K]\left[\left(A_{1} K\right) / K\right] \cdots\left[\left(A_{m-1} K\right) / K\right] \tag{4}
\end{equation*}
$$

of the factor group $G / K$.
Lemma 3. Suppose that $\left(A_{i} H\right) / H$ is not a periodic subset of $G / H$ in the factorization (3) and $\left(A_{i} K\right) / K$ is not a periodic subset of $G / K$ in the factorization (4). Then in the factorization $G=B A_{1} \cdots A_{m}$ the factor $B$ is periodic.
Proof. The group $G$ is a direct product of its subgroups $L, M, N$, where $|L|=p q, N$ is the $r$-component of $G$ and none of the primes $p, q$, $r$ divides $|M|$. Let $x, y$ be a basis for $L$ with $|x|=p,|y|=q$. The element $a \in N$ can be augmented by suitable elements of $N$ to form a basis for $N$. Similarly, the element $a \rho_{2} \in N$ can be augmented by suitable elements to form a basis for $N$. In fact there are elements $z_{1}, \ldots, z_{s-1} \in M N$ such that both $z_{1}, \ldots, z_{s-1}, a$ and $z_{1}, \ldots, z_{s-1}, a \rho_{2}$ form a basis for $M N$. Thus $x, y, z_{1}, \ldots, z_{s}$ form a basis for $G$, where $z_{s}$ is either $a$ or $a \rho_{2}$.

Let us choose $z_{s}$ to be $a$. Each $b \in B$ can be represented uniquely in the form

$$
b=x^{i} y^{j} z_{1}^{\alpha(1, i, j)} \cdots z_{s}^{\alpha(s, i, j)},
$$

where

$$
0 \leq i \leq p-1, \quad 0 \leq j \leq q-1, \quad 0 \leq \alpha(k, i, j) \leq\left|z_{k}\right|-1
$$

The factorization (3) is periodic, by the choice of $m$ and by the assumption of the lemma only $(B H) / H$ can be periodic. We may assume that $x H$ is a period of $(B H) / H$ since this is only a matter of exchanging the roles of the elements $x, y$. It follows that

$$
\alpha(k, 0, j)=\alpha(k, 1, j)=\cdots=\alpha(k, p-1, j)
$$

for each $j, 0 \leq j \leq q-1$ and for each $k, 1 \leq k \leq s-1$. In particular

$$
0=\bar{\alpha}(k, 0,0)=\alpha(k, 1,0)=\cdots=\alpha(k, p-1,0)
$$

as $B$ is a normalized subset of $G$.
The element $\rho_{2}$ can be represented uniquely in the form

$$
\rho_{2}=z_{1}^{\beta(1)} \cdots z_{s}^{\beta(s)}, \quad 0 \leq \beta(i) \leq\left|z_{i}\right|-1 .
$$

Using this $b$ can be written in the form

$$
b=x^{i} y^{j}\left[\prod_{k=1}^{s-1} z_{k}^{\alpha(k, i, j)-\beta(k) \alpha(s, i, j)}\right] a^{\alpha(s, i, j)-\beta(s) \alpha(s, i, j)} \rho_{2}^{\alpha(s, i, j)} .
$$

From $\rho_{2} \neq e$, it follows that one of $\beta(1), \ldots, \beta(s)$ is not zero. For the sake of definiteness we assume that $\beta(1) \neq 0$.

From the factorization (4) it follows that $(B K) / K$ is a periodic subset in $G / K$. We may assume that either $x K$ or $y K$ is a period of $(B K) / K$. Let us first assume that $x K$ is a period of $(B K) / K$. This implies that

$$
\begin{aligned}
& \alpha(1,0, j)-\beta(1) \alpha(s, 0, j)= \\
& \alpha(1,1, j)-\beta(1) \alpha(s, 1, j)=\cdots=\alpha(1, p-1, j)-\beta(1) \alpha(s, p-1, j)
\end{aligned}
$$

As $\beta(1) \neq 0$ we get

$$
\alpha(s, 0, j)=\alpha(s, 1, j)=\cdots=\alpha(s, p-1, j)
$$

and so $B$ is periodic.
Let us assume next that $y K$ is a period of $(B K) / K$ in $G / K$. This implies that

$$
\begin{aligned}
& \alpha(1, i, 0)-\beta(1) \alpha(s, i, 0)= \\
& \alpha(1, i, 1)-\beta(1) \alpha(s, i, 1)=\cdots=\alpha(1, i, q-1)-\beta(1) \alpha(s, i, q-1)=0
\end{aligned}
$$

for each $i, 0 \leq i \leq p-1$. In other words

$$
0=\alpha(1, i, j)-\beta(1) \alpha(s, i, j), \quad 0 \leq i \leq p-1, \quad 0 \leq j \leq q-1
$$

From

$$
\alpha(1,0, j)=\alpha(1,1, j)=\cdots=\alpha(1, p-1, j)
$$

we get

$$
\alpha(s, 0, j)=\alpha(s, 1, j)=\cdots=\alpha(s, p-1, j)
$$

and so $B$ is periodic. $\diamond$
Lemma 4. In a counter-example for $n=4$ the type of $G$ can only be one of the following

$$
\begin{array}{llll}
(p, q, r, r, r, r), & \left(p, q, r^{2}, r, r\right), & \left(p, q, r^{3}, r\right), & \left(p, q, r^{2}, r^{2}\right), \\
(p, q, r, r, r, s), & \left(p, q, r^{2}, r, s\right), & (p, q, r, r, s, s), & \left(p, q, r, r, s^{2}\right), \\
(p, q, r, r, s, t), & &
\end{array}
$$

where $p, q, r, s, t$ are distinct primes.
Proof. By Lemma 2 we may assume that $p$-component of $G$ has order $p$ and the $q$-component of $G$ has order $q$. As the order of $G$ is a product of six not necessarily distinct primes, we need all non-cyclic finite abelian group whose order is a product of four not necessarily distinct primes. $\diamond$

## 3. A special case

This section is devoted to a very special case of Problem 1. Suppose $G=H K$ is a factorization of the finite abelian group $G$, where $H, K$ are subgroups of $G$. Each element $g \in G$ can be represented uniquely in the form

$$
g=a b, \quad a \in H, \quad b \in K
$$

The element $a$ will be called the $H$-part of $g$ and the element $b$ will be referred to as the $K$-part of $g$. Suppose $p$ is a prime divisor of $|G|$. If $H$ is a $p$-group and $|K|$ is not divisible by $p$, then $H$ is called the $p$-component of $G$ and $K$ is called the $p^{\prime}$-component of $G$. The $H$-part of an element $g \in G$ is referred to as the $p$-part of $g$ and the $K$-part of $g$ is referred to as the $p^{\prime}$-part of $g$.

Let $A$ be a normalized subset of $G$ such that $|A|=p$ is a prime. The height of $A$ is defined to be the product of the orders of the $p^{\prime}$-parts of the elements of $A$. Let $A_{1}, \ldots, A_{n}$ be normalized subsets of $G$ with prime cardinalities. The height of a factorization $G=B A_{1} \cdots A_{n}$ is defined to be the product of the heights of the factors $A_{1}, \ldots, A_{n}$.
Theorem 8. Let $G$ be a group of type $(p, q, r, \ldots, r)$, where $p, q, r$ are distinct primes. Let $G=B A_{1} \cdots A_{n}$ be a normalized factorization of $G$ such that $|B|=p q,\left|A_{i}\right|=r$ for each $i, 1 \leq i \leq n$. Then at least one of the factors $B, A_{1}, \ldots, A_{n}$ is periodic.
Proof. We divide the proof into four steps.
Step (1): Suppose there is a counter-example $G=B A_{1} \cdots A_{n}$. We choose a counter-example with minimal $n$. For a fixed $n$ we choose one with a minimal height. Let $x, y, u_{1}, \ldots, u_{n}$ be basis elements of $G$ with $|x|=p,|y|=q,\left|u_{1}\right|=\cdots=\left|u_{n}\right|=r$. Set $L=\left\langle u_{1}, \ldots, u_{n}\right\rangle$. Let $A_{i}^{\prime}$ be the set of the $L$-parts of the elements of $A_{i}$. It is a corollary of Prop. 3 of [7] that in the factorization $G=B A_{1} \cdots A_{n}$ each $A_{i}$ can be replaced by $A_{i}^{\prime}$ to get the normalized factorization $G=B A_{1}^{\prime} \cdots A_{n}^{\prime}$. In particular the product $A_{1}^{\prime} \cdots A_{n}^{\prime}$ is direct. The cardinalities give that $L=A_{1}^{\prime} \cdots A_{n}^{\prime}$ is a factorization of $L$. Thus $G=B L$ is a normalized factorization of $G$. Therefore $B$ is a complete set of representatives in $G$ modulo $L$. The elements of $B$ are in the form

$$
x^{i} y^{j} l_{i, j}, \quad l_{i, j} \in L, \quad 1 \leq i \leq p-1, \quad 1 \leq j \leq q-1
$$

Step (2): If $A_{i} \subseteq L$ for each $i, 1 \leq i \leq n$, then $L=A_{1} \cdots A_{n}$ is a normalized factorization of $L$ and by Th. 2 , one of the factors $A_{1}, \ldots, A_{n}$ is periodic. This is a contradiction. Thus $A_{i} \nsubseteq L$ for some $i, 1 \leq i \leq n$,
say $A_{1} \nsubseteq L$. There is an element $a \in A_{1}$ whose $p$-part or $q$-part is not $e$. Set $A_{1}^{\prime}=\left\{e, a, a^{2}, \ldots, a^{r-1}\right\}$. By Lemma 3 of [12], in the factorization $G=B A_{1} \cdots A_{n}$ the factor $A_{1}$ can be replaced by $A_{1}^{\prime}$ to get the normalized factorization $G=B A_{1}^{\prime} A_{2} \cdots A_{n}$. The element $a$ can be represented in the form $a=a_{1} d_{1}$, where $\left|a_{1}\right|=r,\left|d_{1}\right| \in\{p, q\}$. Set $A_{1}^{\prime \prime}=$ $=\left\{e, a_{1}, a_{1}^{2}, \ldots, a_{1}^{r-2}, a_{1}^{r-1} d_{1}\right\}$. By Lemma 2 of [11], in the factorization $G=B A_{1}^{\prime} A_{2} \cdots A_{n}$ the factor $A_{1}^{\prime}$ can be replaced by $A_{1}^{\prime \prime}$ to get the factorization $G=B A_{1}^{\prime \prime} A_{2} \cdots A_{n}$. In general if $A_{i} \nsubseteq L$, then $A_{i}$ can be replaced by a non-periodic simulated subset. We assume that in the starting counter-example these replacements have already been done. We call a factor $A_{i}$ a type $\alpha$ factor if $A_{i} \nsubseteq L$ and we call $A_{i}$ a type $\beta$ factor if $A_{i} \subseteq L$.

Step (3): If each $A_{i}$ is a type $\alpha$ factor, then by Th. 5 , one of the factors $B, A_{1}, \ldots, A_{n}$ is periodic. This is a contradiction and so there are type $\beta$ factors among $A_{1}, \ldots, A_{n}$. We may assume that $A_{1}, \ldots, A_{s}$ type $\alpha$ factors and $A_{s+1}, \ldots, A_{n}$ are type $\beta$ factors. If $r=2$, then a type $\beta$ factor is obviously a subgroup and consequently it is periodic. Thus in a counter-example $r \geq 3$ must hold. A type $\beta$ factor $A_{i}$ can be expressed in the form

$$
A_{i}=\left\{e, a_{i}, a_{i}^{2} d_{i, 2}, \ldots, a_{i}^{r-1} d_{i, r-1}\right\}
$$

where $d_{i, j} \notin\left\langle a_{i}\right\rangle$. We also use the representation $A_{i}=\left\{a_{i, 0}, \ldots, a_{i, r-1}\right\}$ for $A_{i}$, where

$$
a_{i, 0}=e, a_{i, 1}=a_{i}, a_{i, 2}=a_{i} d_{i, 2}, \ldots, a_{i, r-1}=a_{i} d_{i, r-1}
$$

For notational convenience temporarily we introduce the notation $A_{0}=B$. By Lemma 3 of [11], in the factorization $G=A_{0} \cdots A_{n}$ the factor $A_{n}$ can be replaced by $H_{n, k, m}=\left\langle a_{n, k} a_{n, m}^{-1}\right\rangle$ to get the normalized factorization $G=A_{0} \cdots A_{n-1} H_{n, k, m}$ for each $k, m, k \neq m$. Considering the factor group $G / H_{n, k, m}$ we get the normalized factorization

$$
G / H_{n, k, m}=\left(A_{0} / H_{n, k, m}\right) / H_{n, k, m} \cdots\left(A_{n-1} H_{n, k, m}\right) / H_{n, k, m} .
$$

The minimality of $n$ in the counter-example gives that one of the factors $\left(A_{i} / H_{n, k, m}\right) / H_{n, k, m}$ is periodic. In the $i \neq 0$ case $A_{i} H_{n, k, m}$ is a subgroup of $G$. In the $1 \leq i \leq s$ case $d_{i} \in H_{n, k, m} \subseteq L$ follows. This is a contradiction. Thus $\left(A_{i} / H_{n, k, m}\right) / H_{n, k, m}$ can be periodic only in the $i \in\{0, s+1, \ldots, n\}$ case. In other words for each $i, s+1 \leq i \leq n$ there is an $f(i, k, m) \in$ $\in\{0, s+1, \ldots, n\}$ such that $\left(A_{f(i, k, m)} H_{i, k, m}\right) / H_{i, k, m}$ is periodic. We record this data by constructing a graph $\Gamma$ on the nodes $\{0, s+1, \ldots, n\}$. For each $i, k, m$ we draw an directed edge from $i$ to $f(i, k, m)$.

If for each $i, s+1 \leq i \leq n$ there are $k, m$ such that $f(i, k, m) \in$ $\in\{s+1, \ldots, n\}$, then $\Gamma$ contains a cycle. Let $\Omega \subseteq\{s+1, \ldots, n\}$ be the nodes of this cycle. Note that the product $\prod_{i \in \Omega} A_{i}$ forms a factorization of the group $\prod_{i \in \Omega}\left\langle a_{i}\right\rangle$. By Th. 2, at least one of the factors $A_{i}, i \in \Omega$ is periodic. This is a contradiction. Thus there is an $i, s+1 \leq i \leq n$ such that $\left(B H_{i, k, m}\right) / H_{i, k, m}$ is periodic for each possible choice of $k, m$. We assume that $i=n$. The elements of $\left(B H_{n, k, m}\right) / H_{n, k, m}$ are the following

$$
x^{i} y^{j} l_{i, j}^{\prime} H_{n, k, m}, \quad l_{i, j}^{\prime} \in\left\langle a_{1}, \ldots, a_{n-1}\right\rangle, \quad 0 \leq i \leq p-1, \quad 0 \leq j \leq q-1 .
$$

This set is periodic with period $x H_{n, k, m}$ or $y H_{n, k, m}$.
Step (4): Suppose first that $\left(B H_{n, k, m}\right) / H_{n, k, m}$ is periodic with period $x H_{n, k, m}$. It follows that

$$
l_{0, j}^{\prime}=l_{1, j}^{\prime}=\cdots=l_{p-1, j}^{\prime}
$$

for each $j, 0 \leq j \leq q-1$. Let $l_{j}^{\prime}$ be the common value. Therefore the elements of $B$ are the following

$$
x^{i} y^{j} l_{i, j}^{\prime} a_{n}^{\beta(i, j)}, \quad l_{i, j}^{\prime} \in\left\langle a_{1}, \ldots, a_{n-1}\right\rangle, \quad 0 \leq \beta(i, j) \leq r-1
$$

Here we set $k=1, m=0$ and used the representation

$$
A_{n}=\left\{e, a_{n}, a_{n}^{2} d_{n, 2}, \ldots, a_{n}^{r-1} d_{n, r-1}\right\}
$$

of $A_{n}$. One of $d_{n, 2}, \ldots, d_{n, r-1}$ is not equal to $e$, since otherwise $A_{n}$ is periodic. We may assume that $d_{n, r-1} \neq e$ as $A_{n}$ can be replaced by $A_{n}^{t}$ for each integer $t$ that is relatively prime to $r$. (A little reflection will convince the reader that replacing $A_{n}$ by $A_{n}^{t}$ is not changing the family of subsets $H_{n, k, m}$ originally assigned to $A_{n}$.) Plainly $d_{n, r-1} \in$ $\in\left\langle a_{1}, \ldots, a_{n-1}\right\rangle \backslash\{e\}$. For notational simplicity temporarily set $d=d_{n, r-1}$. There is a $\gamma, 1 \leq \gamma \leq r-1$ for which $a^{\gamma} \in A_{n}^{\gamma}$ holds. In the factorization $G=B A_{1} \cdots A_{n}$ the factor $A_{n}$ can be replaced by $H=\left\langle d^{\gamma} a_{n}\right\rangle$ to get the normalized factorization $G=B A_{1} \cdots A_{n-1} H$. In the factor group $G / H$ the factor $(B H) / H$ must be periodic because of the choice of $A_{n}$. One can write the elements of $B$ in the following form

$$
x^{i} y^{j} l_{j}^{\prime} d^{-\gamma \beta(i, j)}\left(d^{\gamma} a_{n}\right)^{\beta(i, j)} .
$$

Here $l_{j}^{\prime} d^{-\gamma \beta(i, j)} \in\left\langle a_{1}, \ldots, a_{n-1}\right\rangle$ and $\left(d^{\gamma} a_{n}\right)^{\beta(i, j)} \in H$. If $(B H) / H$ is periodic with period $x H$, then it follows that

$$
l_{j}^{\prime} d^{-\gamma \beta(0, j)}=l_{j}^{\prime} d^{-\gamma \beta(1, j)}=\cdots=l_{j}^{\prime} d^{-\gamma \beta(p-1, j)}
$$

for each $j, 0 \leq j \leq q-1$. Therefore

$$
\beta(0, j)=\beta(1, j)=\cdots=\beta(p-1, j)
$$

It implies that $B$ is periodic with period $x$.

To finish the proof note that $A_{n}$ can be replaced by $H_{n, k, m}$ such that there are at least three distinct among the subgroups $H_{n, k, m}$ as $r \geq 3$. By the pigeon-hole principle there are at least two choices of the $k, m$ values for which $\left(B H_{n, k, m}\right) / H_{n, k, m}$ is periodic with period $x H_{n, k, m}$ or there are at least two choices of the $k, m$ values for which $\left(B H_{n, k, m}\right) / H_{n, k, m}$ is periodic with period $y H_{n, k, m}$. For the sake of definiteness suppose that the first possibility occurs. We then carry out the argument above with these particular choices of $k$ and $m$.

This completes the proof. $\diamond$

## 4. Eight propositions

In this long section we deal with the eight group types left open by Lemma 4 and Th. 8.
Proposition 1. Let $G$ be a group of type ( $p, q, r, r, s, t$ ), where $p, q, r$, $s, t$ are distinct primes. Suppose that $G=B A_{1} A_{2} A_{3} A_{4}$ is a normalized factorization such that $|B|=p q,\left|A_{1}\right|=\left|A_{2}\right|=r,\left|A_{3}\right|=s,\left|A_{4}\right|=t$. Then the factorization is periodic.
Proof. We may assume that none of the factors $A_{1}, A_{2}, A_{3}, A_{4}$ is periodic since otherwise there nothing to prove. In the factorization $G=$ $=B A_{1} A_{2} A_{3} A_{4}$ we replace each $A_{i}$ by $D_{i}$ to get the normalized factorization $G=B D_{1} D_{2} D_{3} D_{4}$.

If $D_{4}=A_{4}$, then each element of $A_{4} \backslash\{e\}$ has order $t$ and so $A_{4}$ is equal to the unique subgroup of $G$ of order $t$. This gives the contradiction that $A_{4}$ is periodic. Thus we may assume that $D_{4}=C_{4}$. A similar argument shows that we may assume that $D_{3}=C_{3}$.

If $D_{i}=C_{i}$ for each $i, 1 \leq i \leq 4$, then from the factorization $G=B C_{1} C_{2} C_{3} C_{4}$, by Th. 5 , it follows the contradiction that at least one of the factors $B, C_{1}, C_{2}, C_{3}, C_{4}$ is periodic. By symmetry we may assume that $D_{1}=A_{1}$.

If $D_{2}=A_{2}$, then the product $A_{1} A_{2}$ forms a factorization of the $r$-component of $G$ which is a group of type $(r, r)$. By Th. 2, either $A_{1}$ or $A_{2}$ is periodic. Thus we may assume that $D_{1}=A_{1}, D_{2}=C_{2}, D_{3}=C_{3}$, $D_{4}=C_{4}$. The choices for $\left|a_{1}\right|,\left|a_{2}\right|,\left|a_{3}\right|,\left|a_{4}\right|$ are the following

Table 1: The choices for $\left|a_{1}\right|,\left|a_{2}\right|,\left|a_{3}\right|,\left|a_{4}\right|$ in Prop. 1

$$
\begin{aligned}
& \left|a_{1}\right| \in\{r\}, \\
& \left|a_{2}\right| \in\{r p, r q, r s, r t\}, \\
& \left|a_{3}\right| \in\{s p, s q, s r, s t\}, \\
& \left|a_{4}\right| \in\{t p, t q, t r, t s\} .
\end{aligned}
$$

This leaves 64 cases to consider. These are depicted in Table 1. Set $H=\left\langle A_{1} \cup C_{2} \cup C_{3} \cup C_{4}\right\rangle$. In case $64|H|=\left|A_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|C_{4}\right|$ holds. It follows that $H=A_{1} C_{2} C_{3} C_{4}$ is a factorization. By Th. 2, the factorization is periodic. The same holds in cases $43,44,47,48,59,60,63$.

In case $1|H|=p\left|A_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|C_{4}\right|$ holds. By Lemma 1, it follows that $B$ is periodic. The same holds in cases $1,3,4,9,11,12,13,15,16$, $33,35,36,41,45,49,51,52,57,61$.

In case $32|H|=q\left|A_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|C_{4}\right|$ holds. By Lemma 1, it follows that $B$ is periodic. The same holds in cases $22,23,24,26,27,28,30,31$, $32,38,39,40,42,46,54,55,56,58,62$.

Set $H=\left\langle A_{1} \cup C_{2} \cup C_{3}\right\rangle$. In case $2|H|=p\left|A_{1}\right|\left|C_{2}\right|\left|C_{3}\right|$ holds. From the factorization $G=\left(B C_{4}\right) A_{1} C_{2} C_{3}$, by Lemma 1 , it follows that $B$ is periodic. The same applies in cases 10,34 .

In case $21|H|=q\left|A_{1}\right|\left|C_{2}\right|\left|C_{3}\right|$ holds. From the factorization $G=$ $=\left(B C_{4}\right) A_{1} C_{2} C_{3}$, by Lemma 1, it follows that $B$ is periodic. The same applies in cases $25,37$.

Set $H=\left\langle A_{1} \cup C_{2} \cup C_{4}\right\rangle$. In cases 5, $7,53|H|=p\left|A_{1}\right|\left|C_{2}\right|\left|C_{4}\right|$. From the factorization $G=\left(B C_{3}\right) A_{1} C_{2} C_{4}$, by Lemma 1, it follows that $B$ is periodic. In cases $18,19,50|H|=q\left|A_{1}\right|\left|C_{2}\right|\left|C_{4}\right|$. From the factorization $G=\left(B C_{3}\right) A_{1} C_{2} C_{4}$, by Lemma 1, it follows that $B$ is periodic.

Set $H=\left\langle A_{1} \cup C_{2}\right\rangle$. In case $6|H|=p\left|A_{1}\right|\left|C_{2}\right|\left|C_{4}\right|$ and in case $17|H|=q\left|A_{1}\right|\left|C_{2}\right|\left|C_{4}\right|$. From the factorization $G=\left(B C_{3} C_{4}\right) A_{1} C_{2}$, by Lemma 1, it follows that $B$ is periodic.

In the remaining cases $8,14,20,29$ Lemma 3 is applicable with the type 1 factor $A_{1}$. $\diamond$
Proposition 2. Let $G$ be a group of type $\left(p, q, r^{3}, r\right)$, where $p, q, r$ are distinct primes. Suppose that $G=B A_{1} A_{2} A_{3} A_{4}$ is a normalized factorization such that $|B|=p q,\left|A_{1}\right|=\left|A_{2}\right|=\left|A_{3}\right|=\left|A_{4}\right|=r$. Then the factorization is periodic.
Proof. We may assume that none of the factors $A_{1}, A_{2}, A_{3}, A_{4}$ is periodic since otherwise there nothing to prove. In the factorization $G=$ $=B A_{1} A_{2} A_{3} A_{4}$ we replace each $A_{i}$ by $D_{i}$ to get the normalized factorization $G=B D_{1} D_{2} D_{3} D_{4}$.

If $D_{i}=C_{i}$ for each $i, 1 \leq i \leq 4$, then from the factorization $G=B C_{1} C_{2} C_{3} C_{4}$, by Th. 5 , it follows the contradiction that at least one of the factors $B, C_{1}, C_{2}, C_{3}, C_{4}$ is periodic. By symmetry we may assume that $D_{4}=A_{4}$.

If $D_{3}=A_{3}$, then each element of $A_{3} A_{4} \backslash\{e\}$ has order $p$. Note that $G$ has a unique subgroup of type $(r, r)$. Thus the product $A_{3} A_{4}$ forms a factorization of this subgroup. By Th. 2, either $A_{3}$ or $A_{4}$ is periodic. Thus we may assume that $D_{3}=C_{3}$. A similar argument shows that we may assume that $D_{1}=C_{1}, D_{2}=C_{2}$.

Therefore we may assume that $D_{1}=C_{1}, D_{2}=C_{2}, D_{3}=C_{3}$, $D_{4}=A_{4}$. The choices for $\left|a_{1}\right|,\left|a_{2}\right|,\left|a_{3}\right|,\left|a_{4}\right|$ are the following

$$
\begin{aligned}
& \left|a_{1}\right| \in\left\{r^{3}, r^{2}, r p, r q\right\}, \\
& \left|a_{2}\right| \in\left\{r^{3}, r^{2}, r p, r q\right\}, \\
& \left|a_{3}\right| \in\left\{r^{3}, r^{2}, r p, r q\right\}, \\
& \left|a_{4}\right| \in\{r\} .
\end{aligned}
$$

This leaves 64 cases to consider. These are depicted in Table 2.
Let us consider case 64 . In the factorization $G=B C_{1} C_{2} C_{3} A_{4}$ the factors $C_{1}, C_{2}, C_{3}, A_{4}$ can be replaced by $\left\langle a_{1}^{q}\right\rangle,\left\langle a_{2}^{q}\right\rangle,\left\langle a_{3}^{q}\right\rangle,\left\langle a_{4}\right\rangle$ to get the factorization $G=B\left\langle a_{1}^{q}\right\rangle\left\langle a_{2}^{q}\right\rangle\left\langle a_{3}^{q}\right\rangle\left\langle a_{4}\right\rangle$. This shows that the product $\left\langle a_{1}^{q}\right\rangle\left\langle a_{2}^{q}\right\rangle\left\langle a_{3}^{q}\right\rangle\left\langle a_{4}\right\rangle$ is direct. It follows the contradiction that $G$ has a subgroup of type $(r, r, r)$. The same argument applies in cases $11,12,15$, $16,27,28,31,32,35,36,40,41,42,43,44,45,46,47,48,51,52,55,56$, 57, 58, 59, 60, 61, 62, 63.

Set $H=\left\langle C_{1} \cup C_{2} \cup C_{3} \cup A_{4}\right\rangle$. In cases $1,2,5,6,17,18,21,22|H|=$ $=\left|C_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|A_{4}\right|$. Thus $H=C_{1} C_{2} C_{3} A_{4}$ is a factorization and, by Th. 2, the factorization is periodic. In cases $3,7,9,10,19,23,25,26,33,34$, 37, $38|H|=p\left|C_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|A_{4}\right|$. In the factorization $G=B C_{1} C_{2} C_{3} A_{4}$, by Lemma 1, the factor $B$ is periodic. In cases $4,8,13,14,20,24,29,30,49$, $50,53,54|H|=q\left|C_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|A_{4}\right|$. In the factorization $G=B C_{1} C_{2} C_{3} A_{4}$,
by Lemma 1 , the factor $B$ is periodic. $\diamond$
Proposition 3. Let $G$ be a group of type $\left(p, q, r^{2}, r^{2}\right)$, where $p, q, r$ are distinct primes. Suppose that $G=B A_{1} A_{2} A_{3} A_{4}$ is a normalized factorization such that $|B|=p q,\left|A_{1}\right|=\left|A_{2}\right|=\left|A_{3}\right|=\left|A_{4}\right|=r$. Then the factorization is periodic.
Proof. We may assume that none of the factors $A_{1}, A_{2}, A_{3}, A_{4}$ is periodic since otherwise there nothing to prove. In the factorization $G=$ $=B A_{1} A_{2} A_{3} A_{4}$ we replace each $A_{i}$ by $D_{i}$ to get the normalized factorization $G=B D_{1} D_{2} D_{3} D_{4}$.

If $D_{i}=C_{i}$ for each $i, 1 \leq i \leq 4$, then from the factorization $G=B C_{1} C_{2} C_{3} C_{4}$, by Th. 5 , it follows the contradiction that at least one of the factors $B, C_{1}, C_{2}, C_{3}, C_{4}$ is periodic. By symmetry we may assume that $D_{4}=A_{4}$.

If $D_{3}=A_{3}$, then each element of $A_{3} A_{4} \backslash\{e\}$ has order $p$. Note that $G$ has a unique subgroup of type $(r, r)$. Thus the product $A_{3} A_{4}$ forms a factorization of this subgroup. By Th. 2, either $A_{3}$ or $A_{4}$ is periodic. Thus we may assume that $D_{3}=C_{3}$. A similar argument shows that we may assume that $D_{1}=C_{1}, D_{2}=C_{2}$.

Therefore we may assume that $D_{1}=C_{1}, D_{2}=C_{2}, D_{3}=C_{3}$, $D_{4}=A_{4}$. The choices for $\left|a_{1}\right|,\left|a_{2}\right|,\left|a_{3}\right|,\left|a_{4}\right|$ are the following

$$
\begin{aligned}
& \left|a_{1}\right| \in\left\{r^{2}, r p, r q\right\}, \\
& \left|a_{2}\right| \in\left\{r^{2}, r p, r q\right\}, \\
& \left|a_{3}\right| \in\left\{r^{2}, r p, r q\right\}, \\
& \left|a_{4}\right| \in\{r\},
\end{aligned}
$$

This leaves 27 cases to consider. These are depicted in Table 3.
Set $H=\left\langle C_{1} \cup C_{2} \cup C_{3} \cup A_{4}\right\rangle$. In cases $1 C_{1}, C_{2}, C_{3}, A_{4}$ is in the $r$-component of $G$. Hence $H=C_{1} C_{2} C_{2} A_{4}$ is a factorization and by Th. 2 the factorization is periodic.

In cases $2,4,5,10,11,13,14|H|=p\left|C_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|A_{4}\right|$ and so by Lemma $1, B$ is periodic. In cases $3,7,9,19,21,25,27|H|=$ $=q\left|C_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|A_{4}\right|$ and so by Lemma $1, B$ is periodic.

Consider case 6. In the factorization $G=B C_{1} C_{2} C_{3} A_{4}$ the factors $C_{2}, C_{3}, A_{4}$ can be replaced by $\left\langle a_{2}^{p}\right\rangle,\left\langle a_{3}^{q}\right\rangle,\left\langle a_{4}\right\rangle$. From the factorization $G=B C_{1}\left\langle a_{2}^{p}\right\rangle\left\langle a_{3}^{q}\right\rangle\left\langle a_{4}\right\rangle$ one can draw the conclusion that the product $\left\langle a_{2}^{p}\right\rangle\left\langle a_{3}^{q}\right\rangle\left\langle a_{4}\right\rangle$ is direct. This leads to the contradiction that $G$ has a subgroup of type $(r, r, r)$. A similar argument can be used in all the remaining cases. $\diamond$

| $\left\|a_{2}\right\|$ | $r^{2}$ | $r^{2}$ | $r^{2}$ | $r p$ | $r p$ | $r p$ | $r q$ | $r q$ | $r q$ |
| $\left\|a_{3}\right\|$ | $r^{2}$ | $r p$ | $r q$ | $r^{2}$ | $r p$ | $r q$ | $r^{2}$ | $r p$ | $r q$ |
| $\left\|a_{4}\right\|$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ |
| Case | 19 | 20 | 21 | 22 | 23 | 24 | 25 | 26 | 27 |
| $\left\|a_{1}\right\|$ | $r q$ | $r q$ | $r q$ | $r q$ | $r q$ | $r q$ | $r q$ | $r q$ | $r q$ |
| $\left\|a_{2}\right\|$ | $r^{2}$ | $r^{2}$ | $r^{2}$ | $r p$ | $r p$ | $r p$ | $r q$ | $r q$ | $r q$ |
| $\left\|a_{3}\right\|$ | $r^{2}$ | $r p$ | $r q$ | $r^{2}$ | $r p$ | $r q$ | $r^{2}$ | $r p$ | $r q$ |
| $\left\|a_{4}\right\|$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ |

Proposition 4. Let $G$ be a group of type $\left(p, q, r^{2}, r, r\right)$, where $p$, $q$, $r$ are distinct primes. Suppose that $G=B A_{1} A_{2} A_{3} A_{4}$ is a normalized factorization such that $|B|=p q,\left|A_{1}\right|=\left|A_{2}\right|=\left|A_{3}\right|=\left|A_{4}\right|=r$. Then the factorization is periodic.
Proof. We may assume that none of the factors $A_{1}, A_{2}, A_{3}, A_{4}$ is periodic since otherwise there nothing to prove. In the factorization $G=$ $=B A_{1} A_{2} A_{3} A_{4}$ we replace each $A_{i}$ by $D_{i}$ to get the normalized factorization $G=B D_{1} D_{2} D_{3} D_{4}$.

If $D_{i}=C_{i}$ for each $i, 1 \leq i \leq 4$, then from the factorization $G=B C_{1} C_{2} C_{3} C_{4}$, by Th. 5 , it follows the contradiction that at least one of the factors $B, C_{1}, C_{2}, C_{3}, C_{4}$ is periodic. By symmetry we may assume that $D_{4}=A_{4}$.

If $D_{2}=A_{2}, D_{3}=A_{3}$, then each element of $A_{2} A_{3} A_{4} \backslash\{e\}$ has order $p$. Note that $G$ has a unique subgroup of type $(r, r, r)$. Thus the product $A_{2} A_{3} A_{4}$ forms a factorization of this subgroup. By Th. 2, one of $A_{2}, A_{3}$, $A_{4}$ is periodic. Thus by symmetry we may assume that $D_{2}=C_{2}$.

Therefore we may assume that one of the following situations holds

$$
\begin{array}{llll}
D_{1}=C_{1}, & D_{2}=C_{2}, & D_{3}=A_{3}, & D_{4}=A_{4} \\
D_{1}=C_{1}, & D_{2}=C_{2}, & D_{3}=C_{3}, & D_{4}=A_{4}
\end{array}
$$

Table 4: The choices for $\left|a_{1}\right|,\left|a_{2}\right|,\left|a_{3}\right|,\left|a_{4}\right|$ in Prop. 4

| Case | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\left\|a_{1}\right\|$ | $r^{2}$ | $r^{2}$ | $r^{2}$ | $r p$ | $r p$ | $r p$ | $r q$ | $r q$ | $r q$ |
| $\left\|a_{2}\right\|$ | $r^{2}$ | $r p$ | $r q$ | $r^{2}$ | $r p$ | $r q$ | $r^{2}$ | $r p$ | $r q$ |
| $\left\|a_{3}\right\|$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ |
| $\left\|a_{4}\right\|$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ |

The choices for $\left|a_{1}\right|,\left|a_{2}\right|,\left|a_{3}\right|,\left|a_{4}\right|$ are the following

$$
\begin{array}{ll}
\left|a_{1}\right| \in\left\{r^{2}, r p, r q\right\}, & \left|a_{1}\right| \in\left\{r^{2}, r p, r q\right\}, \\
\left|a_{2}\right| \in\left\{r^{2}, r p, r q\right\}, & \left|a_{2}\right| \in\left\{r^{2}, r p, r q\right\}, \\
\left|a_{3}\right| \in\{r\}, & \left|a_{3}\right| \in\left\{r^{2}, r p, r q\right\}, \\
\left|a_{4}\right| \in\{r\}, & \left|a_{4}\right| \in\{r\} .
\end{array}
$$

This leaves 9 and 27 cases to consider, respectively. These are depicted in Table 4 and Table 3.

Let us deal with Table 4 first. Set $H=\left\langle C_{1} \cup C_{2} \cup A_{3} \cup A_{4}\right\rangle$. In case $1|H|=\left|C_{1}\right|\left|C_{2}\right|\left|A_{3}\right|\left|A_{4}\right|$ and so $H=C_{1} C_{2} A_{3} A_{4}$ is a factorization. By Th. 2, the factorization is periodic. In cases $2,4,5|H|=$ $=p\left|C_{1}\right|\left|C_{2}\right|\left|A_{3}\right|\left|A_{4}\right|$. By Lemma $1, B$ is periodic. In cases 3, $7,9|H|=$ $=q\left|C_{1}\right|\left|C_{2}\right|\left|A_{3}\right|\left|A_{4}\right|$. By Lemma 1, $B$ is periodic.

Consider case 6 . In the factorization $G=B C_{1} C_{2} A_{3} A_{4}$ the factors $C_{1}, C_{2}, A_{3}, A_{4}$ can be replaced by $\left\langle a_{1}^{p}\right\rangle,\left\langle a_{2}^{q}\right\rangle,\left\langle a_{3}\right\rangle,\left\langle a_{4}\right\rangle$. This means that the product $\left\langle a_{1}^{p}\right\rangle\left\langle a_{2}^{q}\right\rangle\left\langle a_{3}\right\rangle\left\langle a_{4}\right\rangle$ is direct. This leads to the contradiction that $G$ has a subgroup of type $(r, r, r, r)$. Case 8 can be settled in a similar way.

Next let us deal with Table 3. Set $H=\left\langle C_{1} \cup C_{2} \cup C_{3} \cup A_{4}\right\rangle$. In case $1|H|=\left|C_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|A_{4}\right|$ and so $H=C_{1} C_{2} C_{3} A_{4}$ is a factorization. By Th. 2, the factorization is periodic. In cases 2, 4, 5, $1011,13|H|=$ $=p\left|C_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|A_{4}\right|$. By Lemma $1, B$ is periodic. In cases $3,7,9,19,21$, $25|H|=q\left|C_{1}\right|\left|C_{2}\right|\left|A_{3}\right|\left|A_{4}\right|$. By Lemma $1, B$ is periodic.

Let us consider case 27. In the factorization $G=B C_{1} C_{2} C_{3} A_{4}$ the factors $C_{1}, C_{2}, C_{3}, A_{4}$ can be replaced by $\left\langle a_{1}^{q}\right\rangle,\left\langle a_{2}^{q}\right\rangle,\left\langle a_{3}^{q}\right\rangle,\left\langle a_{4}\right\rangle$ to get the factorization $G=B\left\langle a_{1}^{q}\right\rangle\left\langle a_{2}^{q}\right\rangle\left\langle a_{3}^{q}\right\rangle\left\langle a_{4}\right\rangle$. This shows that the product $\left\langle a_{1}^{q}\right\rangle\left\langle a_{2}^{q}\right\rangle\left\langle a_{3}^{q}\right\rangle\left\langle a_{4}\right\rangle$ is direct. It follows the contradiction that $G$ has a subgroup of type $(r, r, r, r)$. The same argument applies in cases 14, 15 17, 18, 23, 24, 26.

We are left with cases $6,8,12,16,20,22$. By symmetry it is enough
to settle case 8. In this case we carry out a more detailed analysis.
In the factorization $G=B C_{1} C_{2} C_{3} A_{4}$ the factors $C_{2}, C_{3}, A_{4}$ can be replaced by $\left\langle a_{2}^{q}\right\rangle,\left\langle a_{3}^{p}\right\rangle,\left\langle a_{4}\right\rangle$ to get the factorization $G=B C_{1}\left\langle a_{2}^{q}\right\rangle\left\langle a_{3}^{p}\right\rangle\left\langle a_{4}\right\rangle$. The product $C_{1}\left\langle a_{2}^{q}\right\rangle\left\langle a_{3}^{p}\right\rangle\left\langle a_{4}\right\rangle$ forms a factorization of the $r$-component of $G$ which is a group of type $\left(r^{2}, r, r\right)$. It follows that one of

$$
\left\{a_{1}, a_{2}^{q}, a_{3}^{p}\right\}, \quad\left\{a_{1}, a_{3}^{p}, a_{4}\right\}, \quad\left\{a_{1}, a_{2}^{q}, a_{4}\right\}
$$

is a basis for the $r$-component of $G$. The elements of $G$ of order $r$ together with the identity element form a unique subgroup of $G$ of type $(r, r, r)$. One of

$$
\left\{a_{1}^{r}, a_{2}^{q}, a_{3}^{p}\right\}, \quad\left\{a_{1}^{r}, a_{3}^{p}, a_{4}\right\}, \quad\left\{a_{1}^{r}, a_{2}^{q}, a_{4}\right\}
$$

is a basis of this subgroup.
The subgroup $N=\left\langle A_{4}\right\rangle$ is of type $(r, r)$ or $(r, r, r)$. Suppose first that $N$ is of type $(r, r)$. If $a_{2}^{q} \notin N$, then set $H=\left\langle C_{1} \cup C_{3} \cup A_{4}\right\rangle$. Now $|H|=q\left|C_{1}\right|\left|C_{3}\right|\left|A_{4}\right|$ and so by Lemma $1, B$ is periodic. If $a_{3}^{p} \notin N$, then set $H=\left\langle C_{1} \cup C_{2} \cup A_{4}\right\rangle$. Now $|H|=p\left|C_{1}\right|\left|C_{2}\right|\left|A_{4}\right|$ and so by Lemma 1, $B$ is periodic. It remains that $a_{2}^{q}, a_{3}^{p} \in N$. It follows that $a_{2}^{q}, a_{3}^{p}$ form a basis for $N$. But then the product $\left\langle a_{2}^{q}\right\rangle\left\langle a_{3}^{p}\right\rangle\left\langle a_{4}\right\rangle$ cannot be direct.

Suppose next that $N$ is of type $(r, r, r)$. Let

$$
K=\left\langle a_{2}^{q}\right\rangle, \quad L=\left\langle a_{3}^{p}\right\rangle, \quad M=\left\langle a_{4}\right\rangle .
$$

Consider the factorizations

$$
\begin{align*}
G / K & =[(B K) / K]\left[\left(C_{1} K\right) / K\right]\left[\left(C_{3} K\right) / K\right]\left[\left(A_{4} K\right) / K\right],  \tag{5}\\
G / L & =[(B L) / L]\left[\left(C_{1} L\right) / L\right]\left[\left(C_{2} L\right) / L\right]\left[\left(A_{4} L\right) / L\right],  \tag{6}\\
G / M & =[(B M) / M]\left[\left(C_{1} M\right) / M\right]\left[\left(C_{2} M\right) / M\right]\left[\left(C_{3} M\right) / M\right] . \tag{7}
\end{align*}
$$

If $a_{1}^{r}, a_{2}^{q}, a_{3}^{p}$ is a basis for $N$, then $a_{1}^{r} \notin K$ and so $\left(C_{1} K\right) / K$ cannot be periodic in (5). Plainly, $a_{3}^{r} \notin K$ and so $\left(C_{3} K\right) / K$ cannot be periodic in (5). As $N$ is of type $(r, r, r),\left(A_{4} K\right) / K$ cannot be periodic in (5). Thus $(B K) / K$ must be periodic in (5). An analogous argument gives that $(B L) / L$ is periodic in (6). In the way we have seen in the proof of Lemma 3 we can conclude that $B$ is periodic.

If $a_{1}^{r}, a_{3}^{p}, a_{4}$ is a basis for $N$, then $a_{1}^{r} \notin L$ and so $\left(C_{1} L\right) / L$ cannot be periodic in (6). Plainly, $a_{2}^{r} \notin L$ and so $\left(C_{2} K\right) / K$ cannot be periodic in (6). As $N$ is of type $(r, r, r),\left(A_{4} L\right) / L$ cannot be periodic in (6). Thus $(B L) / L$ must be periodic in (6). An analogous argument gives that $(B M) / M$ is periodic in (7). Again we can conclude that $B$ is periodic.

The case when $a_{1}^{r}, a_{2}^{q}, a_{4}$ is a basis for $N$ can be settled in a similar way. $\diamond$

| $\left\|a_{3}\right\|$ | $s^{2}$ | $s^{2}$ | $s^{2}$ | $s^{2}$ | $s p$ | $s p$ | $s p$ | $s p$ | $s q$ | $s q$ | $s q$ | $s q$ | $s r$ | $s r$ | $s r$ | $s r$ |
| $\left\|a_{4}\right\|$ | $s^{2}$ | $s p$ | $s q$ | $s r$ | $s^{2}$ | $s p$ | $s q$ | $s r$ | $s^{2}$ | $s p$ | $s q$ | $s r$ | $s^{2}$ | $s p$ | $s q$ | $s r$ |

Proposition 5. Let $G$ be a group of type $\left(p, q, r, r, s^{2}\right)$, where $p, q, r$, $s$ are distinct primes. Suppose that $G=B A_{1} A_{2} A_{3} A_{4}$ is a normalized factorization such that $|B|=p q,\left|A_{1}\right|=\left|A_{2}\right|=r,\left|A_{3}\right|=\left|A_{4}\right|=s$. Then the factorization is periodic.
Proof. We may assume that none of the factors $A_{1}, A_{2}, A_{3}, A_{4}$ is periodic since otherwise there nothing to prove. In the factorization $G=$ $=B A_{1} A_{2} A_{3} A_{4}$ we replace each $A_{i}$ by $D_{i}$ to get the normalized factorization $G=B D_{1} D_{2} D_{3} D_{4}$.

If $D_{4}=A_{4}$, then each element of $A_{4} \backslash\{e\}$ has order $s$ and so $A_{4}$ is equal to the unique subgroup of $G$ of order $s$. This gives the contradiction that $A_{4}$ is periodic. Thus we may assume that $D_{4}=C_{4}$. A similar argument shows that we may assume that $D_{3}=C_{3}$.

If $D_{i}=C_{i}$ for each $i, 1 \leq i \leq 4$, then from the factorization $G=B C_{1} C_{2} C_{3} C_{4}$, by Th. 5 , it follows the contradiction that at least one of the factors $B, C_{1}, C_{2}, C_{3}, C_{4}$ is periodic. By symmetry we may assume that $D_{1}=A_{1}$.

If $D_{2}=A_{2}$, then the product $A_{1} A_{2}$ forms a factorization of the $r$-component of $G$ which is a group of type $(r, r)$. By Th. 2 , either $A_{1}$ or $A_{2}$ is periodic. Thus we may assume that $D_{1}=A_{1}, D_{2}=C_{2}, D_{3}=C_{3}$, $D_{4}=C_{4}$. The choices for $\left|a_{1}\right|,\left|a_{2}\right|,\left|a_{3}\right|,\left|a_{4}\right|$ are the following

$$
\begin{aligned}
& \left|a_{1}\right| \in\{r\} \\
& \left|a_{2}\right| \in\{r p, r q, r s\} \\
& \left|a_{3}\right| \in\left\{s^{2}, s p, s q, s r\right\} \\
& \left|a_{4}\right| \in\left\{s^{2}, s p, s q, s r\right\} .
\end{aligned}
$$

There are 16 choices for $\left|a_{3}\right|,\left|a_{4}\right|$ which are depicted in Table 5 . In case 1 the product $C_{3} C_{4}$ forms a factorization of the $s$-component of $G$. By Th. 2, we get the contradiction that one of $C_{3}, C_{4}$ is periodic.

In case 6 in the factorization $G=B A_{1} C_{2} C_{3} C_{4}$ the factors $C_{3}, C_{4}$ can be replaced by $\left\langle a_{3}^{p}\right\rangle,\left\langle a_{4}^{p}\right\rangle$. This leads to the contradiction that $G$ has a subgroup of type $(s, s)$. Using a similar argument we can sort out the cases $7,8,10,11,12,14,15,16$.

Table 6: The choices for $\left|a_{1}\right|,\left|a_{2}\right|,\left|a_{3}\right|,\left|a_{4}\right|$ in Prop. 5

| Case | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\left\|a_{1}\right\|$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ |
| $\left\|a_{2}\right\|$ | $r p$ | $r p$ | $r p$ | $r q$ | $r q$ | $r q$ | $r s$ | $r s$ | $r s$ |
| $\left\|a_{3}\right\|$ | $s^{2}$ | $s^{2}$ | $s^{2}$ | $s^{2}$ | $s^{2}$ | $s^{2}$ | $s^{2}$ | $s^{2}$ | $s^{2}$ |
| $\left\|a_{4}\right\|$ | $s p$ | $s q$ | $s r$ | $s p$ | $s q$ | $s r$ | $s p$ | $s q$ | $s r$ |

By symmetry we may assume that $\left|a_{3}\right| \in\left\{s^{2}\right\},\left|a_{4}\right| \in\{s p, s q, s r\}$. So there are 9 choices for $\left|a_{1}\right|,\left|a_{2}\right|,\left|a_{3}\right|,\left|a_{4}\right|$ to consider. These cases are depicted in Table 6.

Set $H=\left\langle A_{1} \cup C_{2} \cup C_{3} \cup C_{4}\right\rangle$. In case $9|H|=\left|A_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|C_{4}\right|$ and so $H=A_{1} C_{2} C_{3} C_{4}$ is a factorization. By Th. 2, the factorization is periodic. In cases $1,3,7|H|=p\left|A_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|C_{4}\right|$ and in cases $5,6,8$ $|H|=q\left|A_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|C_{4}\right|$. By Lemma $1, B$ is periodic.

In cases 2, 4 Lemma 3 is applicable with the type 1 set $A_{1} . \diamond$
Proposition 6. Let $G$ be a group of type ( $p, q, r^{2}, r, s$ ), where $p, q, r$, $s$ are distinct primes. Suppose that $G=B A_{1} A_{2} A_{3} A_{4}$ is a normalized factorization such that $|B|=p q,\left|A_{1}\right|=\left|A_{2}\right|=\left|A_{3}\right|=r,\left|A_{4}\right|=s$. Then the factorization is periodic.
Proof. We may assume that none of the factors $A_{1}, A_{2}, A_{3}, A_{4}$ is periodic since otherwise there nothing to prove. In the factorization $G=$ $=B A_{1} A_{2} A_{3} A_{4}$ we replace each $A_{i}$ by $D_{i}$ to get the normalized factorization $G=B D_{1} D_{2} D_{3} D_{4}$.

If $D_{4}=A_{4}$, then each element of $A_{4} \backslash\{e\}$ has order $s$ and so $A_{4}$ is equal to the unique subgroup of $G$ of order $s$. This gives the contradiction that $A_{4}$ is periodic. Thus we may assume that $D_{4}=C_{4}$.

If $D_{i}=C_{i}$ for each $i, 1 \leq i \leq 4$, then from the factorization $G=B C_{1} C_{2} C_{3} C_{4}$, by Th. 5 , it follows the contradiction that at least one of the factors $B, C_{1}, C_{2}, C_{3}, C_{4}$ is periodic. By symmetry we may assume that $D_{1}=A_{1}$.

If $D_{2}=A_{2}$, then each element of $A_{1} A_{2} \backslash\{e\}$ has order $r$. The elements of $G$ of order $r$ together with $e$ form a unique subgroup of $G$ of type $(r, r)$. Therefore the product $A_{1} A_{2}$ forms a factorization of this subgroup of $G$. By Th. 2, either $A_{1}$ or $A_{2}$ is periodic. Thus we may assume that $D_{1}=A_{1}, D_{2}=C_{2}, D_{3}=C_{3}, D_{4}=C_{4}$. The choices for $\left|a_{1}\right|$, $\left|a_{2}\right|,\left|a_{3}\right|,\left|a_{4}\right|$ are the following

Table 7: The choices for $\left|a_{1}\right|,\left|a_{2}\right|,\left|a_{3}\right|$ in Prop. 6

| $\left\|a_{2}\right\|$ | $r^{2}$ | $r^{2}$ | $r^{2}$ | $r^{2}$ | $r p$ | $r p$ | $r p$ | $r p$ | $r q$ | $r q$ | $r q$ | $r q$ | $r s$ | $r s$ | $r s$ | $r s$ |
| $\left\|a_{3}\right\|$ | $r^{2}$ | $r p$ | $r q$ | $r s$ | $s^{2}$ | $r p$ | $r q$ | $r s$ | $r^{2}$ | $r p$ | $r q$ | $s r$ | $r^{2}$ | $s p$ | $r q$ | $r s$ |

Table 8: The choices for $\left|a_{1}\right|,\left|a_{2}\right|,\left|a_{3}\right|,\left|a_{4}\right|$ in Prop. 6

| Case | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\left\|a_{1}\right\|$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ |
| $\left\|a_{2}\right\|$ | $r^{2}$ | $r^{2}$ | $r^{2}$ | $r^{2}$ | $r^{2}$ | $r^{2}$ | $r^{2}$ | $r^{2}$ | $r^{2}$ |
| $\left\|a_{3}\right\|$ | $r p$ | $r p$ | $r p$ | $r q$ | $r q$ | $r q$ | $r s$ | $r s$ | $r s$ |
| $\left\|a_{4}\right\|$ | $s p$ | $s q$ | $s r$ | $s p$ | $s q$ | $s r$ | $s p$ | $s q$ | $s r$ |

$$
\begin{aligned}
& \left|a_{1}\right| \in\{r\}, \\
& \left|a_{2}\right| \in\left\{r^{2}, r p, r q, r s\right\}, \\
& \left|a_{3}\right| \in\left\{r^{2}, r p, r q, r s\right\}, \\
& \left|a_{4}\right| \in\{s p, s q, s r\} .
\end{aligned}
$$

There are 16 choices for $\left|a_{1},\left|a_{2}\right|,\left|a_{3}\right|\right.$ which are depicted in Table 7. In case 1 the product $A_{1} C_{2} C_{3}$ forms a factorization of the $r$-component of $G$. By Th. 2, we get the contradiction that one of $A_{1}, C_{2}, C_{3}$ is periodic.

In case 6 in the factorization $G=B A_{1} C_{2} C_{3} C_{4}$ the factors $A_{1}, C_{2}$, $C_{3}$ can be replaced by $\left\langle a_{1}\right\rangle,\left\langle a_{2}^{p}\right\rangle,\left\langle a_{3}^{p}\right\rangle$. This leads to the contradiction that $G$ has a subgroup of type $(r, r, r)$. Using a similar argument we can sort out the cases $7,8,10,11,12,14,15,16$.

By symmetry we may assume that $\left|a_{2}\right| \in\left\{r^{2}\right\},\left|a_{3}\right| \in\{r p, r q, r s\}$. So there are 9 choices for $\left|a_{1}\right|,\left|a_{2}\right|,\left|a_{3}\right|,\left|a_{4}\right|$ to consider. These cases are depicted in Table 8.

Set $H=\left\langle A_{1} \cup C_{2} \cup C_{3} \cup C_{4}\right\rangle$. In case $9|H|=\left|A_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|C_{4}\right|$ and so $H=A_{1} C_{2} C_{3} C_{4}$ is a factorization. By Th. 2, the factorization is periodic. In cases $1,3,7|H|=p\left|A_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|C_{4}\right|$ and in cases $5,6,8$ $|H|=q\left|A_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|C_{4}\right|$. By Lemma $1, B$ is periodic.

Set $H=\left\langle A_{1} \cup C_{2} \cup C_{3}\right\rangle$. In case $2|H|=p\left|A_{1}\right|\left|C_{2}\right|\left|C_{3}\right|$ and in case $4|H|=q\left|A_{1}\right|\left|C_{2}\right|\left|C_{3}\right|$. From the factorization $G=\left(B C_{4}\right) A_{1} C_{2} C_{3}$ by Lemma 1, it follows that $B$ is periodic. $\diamond$
Proposition 7. Let $G$ be a group of type ( $p, q, r, r, s, s$ ), where $p, q, r$,

Table 9: The choices for $\left|a_{1}\right|,\left|a_{2}\right|,\left|a_{3}\right|,\left|a_{4}\right|$ in Prop. 7

| Case | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\left\|a_{1}\right\|$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ |
| $\left\|a_{2}\right\|$ | $r p$ | $r p$ | $r p$ | $r q$ | $r q$ | $r q$ | $r s$ | $r s$ | $r s$ |
| $\left\|a_{3}\right\|$ | $s$ | $s$ | $s$ | $s$ | $s$ | $s$ | $s$ | $s$ | $s$ |
| $\left\|a_{4}\right\|$ | $s p$ | $s q$ | $s r$ | $s p$ | $s q$ | $s r$ | $s p$ | $s q$ | $s r$ |

$s$ are distinct primes. Suppose that $G=B A_{1} A_{2} A_{3} A_{4}$ is a normalized factorization such that $|B|=p q,\left|A_{1}\right|=\left|A_{2}\right|=r,\left|A_{3}\right|=\left|A_{4}\right|=s$. Then the factorization is periodic.
Proof. We may assume that none of the factors $A_{1}, A_{2}, A_{3}, A_{4}$ is periodic since otherwise there nothing to prove. In the factorization $G=$ $=B A_{1} A_{2} A_{3} A_{4}$ we replace each $A_{i}$ by $D_{i}$ to get the normalized factorization $G=B D_{1} D_{2} D_{3} D_{4}$.

If $D_{i}=C_{i}$ for each $i, 1 \leq i \leq 4$, then from the factorization $G=B C_{1} C_{2} C_{3} C_{4}$, by Th. 5 , it follows the contradiction that at least one of the factors $B, C_{1}, C_{2}, C_{3}, C_{4}$ is periodic. By symmetry we may assume that $D_{1}=A_{1}$.

If $D_{2}=A_{2}$, then the product $A_{1} A_{2}$ forms a factorization of the $r$-component of $G$. By Th. 2, either $A_{1}$ or $A_{2}$ is periodic. Thus we may assume that $D_{2}=C_{2}$.

If $D_{3}=A_{3}, D_{4}=A_{4}$, then the product $A_{3} A_{4}$ forms a factorization of the $s$-component of $G$. It follows that either $A_{3}$ or $A_{4}$ is periodic. By symmetry we may assume that $D_{4}=C_{4}$.

Therefore we may assume that one of the following situations holds

$$
\begin{array}{llll}
D_{1}=A_{1}, & D_{2}=C_{2}, & D_{3}=A_{3}, & D_{4}=C_{4} \\
D_{1}=A_{1}, & D_{2}=C_{2}, & D_{3}=C_{3}, & D_{4}=C_{4}
\end{array}
$$

The choices for $\left|a_{1}\right|,\left|a_{2}\right|,\left|a_{3}\right|,\left|a_{4}\right|$ are the following

$$
\begin{array}{ll}
\left|a_{1}\right| \in\{r\}, & \left|a_{1}\right| \in\{r\}, \\
\left|a_{2}\right| \in\{r p, r q, r s\}, & \left|a_{2}\right| \in\{r p, r q, r s\}, \\
\left|a_{3}\right| \in\{s\}, & \left|a_{3}\right| \in\{s p, s q, s r\}, \\
\left|a_{4}\right| \in\{s p, s q, s r\}, & \left|a_{4}\right| \in\{s p, s q, s r\} .
\end{array}
$$

This leaves 9 and 27 cases to consider, respectively. These are depicted in Table 9 and Table 10.

Let us deal with Table 9 first. Set $H=\left\langle A_{1} \cup C_{2} \cup A_{3} \cup C_{4}\right\rangle$. In case $9|H|=\left|A_{1}\right|\left|C_{2}\right|\left|A_{3}\right|\left|C_{4}\right|$ and so $H=A_{1} C_{2} A_{3} C_{4}$ is a factoriza-

tion. By Th. 2, the factorization is periodic. In cases $1,3,7|H|=$ $=p\left|A_{1}\right|\left|C_{2}\right|\left|A_{3}\right|\left|C_{4}\right|$ and in cases 5, 6, $8|H|=q\left|A_{1}\right|\left|C_{2}\right|\left|A_{3}\right|\left|C_{4}\right|$. By Lemma $1, B$ is periodic.

In cases 2,4 Lemma 3 is applicable with the type 1 subset $A_{3}$.
Next let us deal with Table 10. Set $H=\left\langle A_{1} \cup C_{2} \cup C_{3} \cup C_{4}\right\rangle$. In case $27|H|=\left|A_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|C_{4}\right|$ and so $H=A_{1} C_{2} C_{3} C_{4}$ is a factorization. By Th. 2, the factorization is periodic. In cases $1,3,7,9,19,21,25$ $|H|=p\left|A_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|C_{4}\right|$ and in cases $14,15,17,18,23,24,26|H|=$ $=q\left|A_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|C_{4}\right|$. By Lemma 1, $B$ is periodic.

Set $H=\left\langle A_{1} \cup C_{2} \cup C_{4}\right\rangle$. In case $6|H|=p\left|A_{1}\right|\left|C_{2}\right|\left|C_{4}\right|$ and in case $12|H|=p\left|A_{1}\right|\left|C_{2}\right|\left|C_{4}\right|$. From the factorization $G=\left(B C_{3}\right) A_{1} C_{2} C_{4}$, by Lemma 1, it follows that $B$ is periodic.

In the remaining cases Lemma 3 is applicable with the type 1 subset $A_{1} . \diamond$

Proposition 8. Let $G$ be a group of type ( $p, q, r, r, r, s$ ), where $p, q, r$, $s$ are distinct primes. Suppose that $G=B A_{1} A_{2} A_{3} A_{4}$ is a normalized factorization such that $|B|=p q,\left|A_{1}\right|=\left|A_{2}\right|=\left|A_{3}\right|=r,\left|A_{4}\right|=s$. Then the factorization is periodic.
Proof. We may assume that none of the factors $A_{1}, A_{2}, A_{3}, A_{4}$ is pe-

Table 11: The choices for $\left|a_{1}\right|,\left|a_{2}\right|,\left|a_{3}\right|,\left|a_{4}\right|$ in Prop. 8

| Case | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\left\|a_{1}\right\|$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ |
| $\left\|a_{2}\right\|$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ |
| $\left\|a_{3}\right\|$ | $r p$ | $r p$ | $r p$ | $r q$ | $r q$ | $r q$ | $r s$ | $r s$ | $r s$ |
| $\left\|a_{4}\right\|$ | $s p$ | $s q$ | $s r$ | $s p$ | $s q$ | $s r$ | $s p$ | $s q$ | $s r$ |

riodic since otherwise there nothing to prove. In the factorization $G=$ $=B A_{1} A_{2} A_{3} A_{4}$ we replace each $A_{i}$ by $D_{i}$ to get the normalized factorization $G=B D_{1} D_{2} D_{3} D_{4}$.

If $D_{4}=A_{4}$, then each element of $A_{4} \backslash\{e\}$ has order $s$ and so $A_{4}$ is equal to to the unique subgroup of $G$ of order $s$. Thus we may assume that $D_{4}=C_{4}$.

If $D_{i}=C_{i}$ for each $i, 1 \leq i \leq 4$, then from the factorization $G=B C_{1} C_{2} C_{3} C_{4}$, by Th. 5 , it follows the contradiction that at least one of the factors $B, C_{1}, C_{2}, C_{3}, C_{4}$ is periodic. By symmetry we may assume that $D_{1}=A_{1}$.

If $D_{i}=A_{i}$ for each $i, 1 \leq i \leq 3$, then the product $A_{1} A_{2} A_{3}$ forms a factorization of the $r$-component of $G$. By Th. 2 , one of $A_{1}, A_{2}, A_{3}$ is periodic. Therefore we may assume that one of the following situations holds

$$
\begin{array}{llll}
D_{1}=A_{1}, & D_{2}=A_{2}, & D_{3}=C_{3}, & D_{4}=C_{4} \\
D_{1}=A_{1}, & D_{2}=C_{2}, & D_{3}=C_{3}, & D_{4}=C_{4}
\end{array}
$$

The choices for $\left|a_{1}\right|,\left|a_{2}\right|,\left|a_{3}\right|,\left|a_{4}\right|$ are the following

$$
\begin{array}{ll}
\left|a_{1}\right| \in\{r\}, & \left|a_{1}\right| \in\{r\}, \\
\left|a_{2}\right| \in\{r\}, & \left|a_{2}\right| \in\{r p, r q, r s\}, \\
\left|a_{3}\right| \in\{r p, r q, r s\}, & \left|a_{3}\right| \in\{r p, r q, r s\}, \\
\left|a_{4}\right| \in\{s p, s q, s r\}, & \left|a_{4}\right| \in\{s p, s q, s r\} .
\end{array}
$$

This leaves 9 and 27 cases to consider, respectively. These are depicted in Table 11 and Table 12.

Let us settle Table 11 first. Set $H=\left\langle A_{1} \cup A_{2} \cup C_{3} \cup C_{4}\right\rangle$. In case $9|H|=\left|A_{1}\right|\left|A_{2}\right|\left|C_{3}\right|\left|C_{4}\right|$ and so $H=A_{1} A_{2} C_{3} C_{4}$ is a factorization. By Th. 2, the factorization is periodic. In cases $1,3,7|H|=$ $=p\left|A_{1}\right|\left|A_{2}\right|\left|C_{3}\right|\left|C_{4}\right|$ and in cases 5, 6, $8|H|=q\left|A_{1}\right|\left|A_{2}\right|\left|C_{3}\right|\left|C_{4}\right|$. By Lemma $1, B$ is periodic.

| Case | 1 | 2 | 3 | 4 | 5 | 6 | 7 | 8 | 9 |
| :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: | :---: |
| $\left\|a_{1}\right\|$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ |
| $\left\|a_{2}\right\|$ | $r p$ | $r p$ | $r p$ | $r p$ | $r p$ | $r p$ | $r p$ | $r p$ | $r p$ |
| $\left\|a_{3}\right\|$ | $r p$ | $r p$ | $r p$ | $r q$ | $r q$ | $r q$ | $r s$ | $r s$ | $r s$ |
| $\left\|a_{4}\right\|$ | $s p$ | $s q$ | $s r$ | $s p$ | $s q$ | $s r$ | $s p$ | $s q$ | $s r$ |
| Case | 10 | 11 | 12 | 13 | 14 | 15 | 16 | 17 | 18 |
| $\left\|a_{1}\right\|$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ |
| $\left\|a_{2}\right\|$ | $r q$ | $r q$ | $r q$ | $r q$ | $r q$ | $r q$ | $r q$ | $r q$ | $r q$ |
| $\left\|a_{3}\right\|$ | $r p$ | $r p$ | $r p$ | $r q$ | $r q$ | $r q$ | $r s$ | $r s$ | $r s$ |
| $\left\|a_{4}\right\|$ | $s p$ | $s q$ | $s r$ | $s p$ | $s q$ | $s r$ | $s p$ | $s q$ | $s r$ |
| Case | 19 | 20 | 21 | 22 | 23 | 24 | 25 | 26 | 27 |
| $\left\|a_{1}\right\|$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ | $r$ |
| $\left\|a_{2}\right\|$ | $r s$ | $r s$ | $r s$ | $r s$ | $r s$ | $r s$ | $r s$ | $r s$ | $r s$ |
| $\left\|a_{3}\right\|$ | $r p$ | $r p$ | $r p$ | $r q$ | $r q$ | $r q$ | $r s$ | $r s$ | $r s$ |
| $\left\|a_{4}\right\|$ | $s p$ | $s q$ | $s r$ | $s p$ | $s q$ | $s r$ | $s p$ | $s q$ | $s r$ |

Set $H=\left\langle A_{1} \cup A_{2} \cup C_{3}\right\rangle$. In case $2|H|=p\left|A_{1}\right|\left|A_{2}\right|\left|C_{3}\right|$ and in cases $5,6,8|H|=q\left|A_{1}\right|\left|A_{2}\right|\left|C_{3}\right|$. From the factorization $G=\left(B C_{4}\right) A_{1} A_{2} C_{3}$, by Lemma $1, B$ is periodic.

Finally let us turn to Table 12. Set $H=\left\langle A_{1} \cup C_{2} \cup C_{3} \cup C_{4}\right\rangle$. In case $27|H|=\left|A_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|C_{4}\right|$ and so $H=A_{1} C_{2} C_{3} C_{4}$ is a factorization. By Th. 2, the factorization is periodic. In cases $1,3,7,9,19,21,25$ $|H|=p\left|A_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|C_{4}\right|$ and in cases 14, 15, 17, 18, 23, 24, $26|H|=$ $=q\left|A_{1}\right|\left|C_{2}\right|\left|C_{3}\right|\left|C_{4}\right|$. By Lemma $1, B$ is periodic.

In cases $4,5,8,10,11,16,20,21$ Lemma 3 is applicable with type 1 subset $A_{1}$. Thus we left with cases 6,12 . These are symmetric cases so it is enough to settle case 6 .

In case 6 we carry out a more detailed analysis. Let $K=\left\langle a_{1}\right\rangle$, $L=\left\langle a_{4}^{r}\right\rangle$. Consider the factorizations

$$
\begin{align*}
G / K & =[(B K) / K]\left[\left(C_{2} K\right) / K\right]\left[\left(C_{3} K\right) / K\right]\left[\left(C_{4} K\right) / K\right],  \tag{8}\\
G / L & =[(B L) / L]\left[\left(A_{1} L\right) / L\right]\left[\left(C_{2} L\right) / L\right]\left[\left(C_{3} L\right) / L\right] . \tag{9}
\end{align*}
$$

In (9) only $(B L) / L$ can be periodic. In (8) $(B K) / K$ or $\left(C_{4} K\right) / K$ can be periodic. If in (8) $(B K) / K$ is periodic, then the argument we used in the proof of Lemma 3 provides that $B$ is periodic. Thus we may assume
that in (8) $\left(C_{4} K\right) / K$ is periodic. This implies that $a_{4}^{r} \in K$.
The subset $A_{1}$ can be written in the form

$$
A_{1}=\left\{e, a_{1}, a_{1}^{2} \rho_{2}, \ldots, a_{1}^{r-1} \rho_{r-1}\right\}, \quad\left|\rho_{i}\right|=r .
$$

If $\rho_{2}, \ldots, \rho_{r-1} \in\left\langle a_{1}\right\rangle$, then $A_{1}$ is periodic. Therefore we may assume that one of $\rho_{2}, \ldots, \rho_{r-1}$ is not an element of $\left\langle a_{1}\right\rangle$. For the sake of definiteness we assume that $\rho_{2} \notin\left\langle a_{1}\right\rangle$.

Multiplying the factorization $G=B A_{1} C_{2} C_{3} C_{4}$ by $a_{1}^{-1}$ we get the factorization $G=G a_{1}^{-1}=B\left(A_{1} a_{1}^{-1}\right) C_{2} C_{3} C_{4}$. Set $M=\left\langle a_{1} \rho_{2}\right\rangle$ and consider the factorization

$$
\begin{equation*}
G / M=[(B M) / L]\left[\left(C_{2} M\right) / M\right]\left[\left(C_{3} M\right) / M\right]\left[\left(C_{4} M\right) / M\right] \tag{10}
\end{equation*}
$$

In (10) only $(B M) / L$ or $\left(C_{4} M\right) / M$ can be periodic. If $(B M) / L$ is periodic, then using the fact that $(B L) / L$ is periodic in (9) we get that $B$ is periodic. Thus we may assume that $\left(C_{4} M\right) / M$ is periodic in (10). This implies that $a_{4}^{r} \in M$. Now $a_{4}^{r} \in K \cap M=\{e\}$ and so $a_{4}^{r}=e$. This means that $C_{4}$ is periodic. $\diamond$
